

Electric Vehicle Supply Equipment

Identifying Key Elements of Interoperability

John Halliwell

Senior Project Manager, Electric Transportation

CEC EVSE Interoperability Staff Workshop

August 15, 2013

Contents

- What are the key interfaces for networked public plug in vehicle charging infrastructure that help to ensure interoperability?
 - A discussion of four interfaces

Some acronyms you might hear me use...

- EVSE – Electric Vehicle Supply Equipment – the Charge Station
- EVSP – Electric Vehicle Service Provider – the Network Provider
- RFID – radio frequency identification – a plastic card or dongle that identifies a user (often a fob on your key chain)

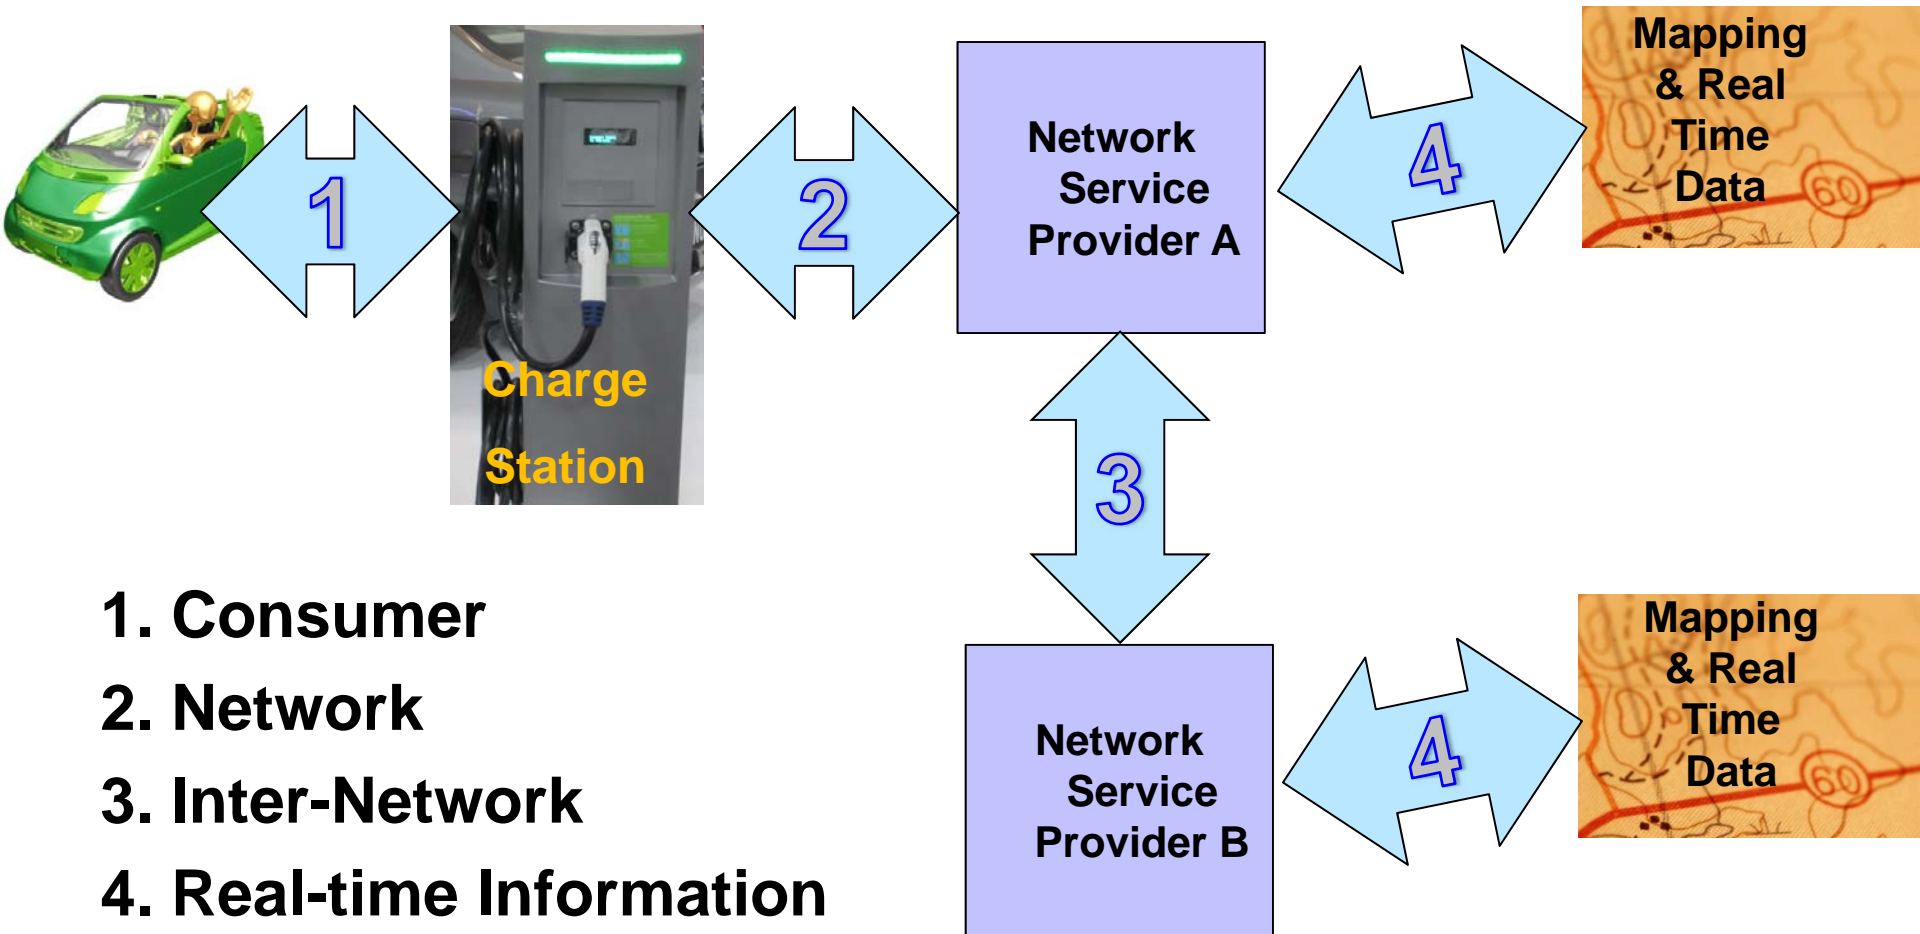

A Cautionary Tale from Hawaii...

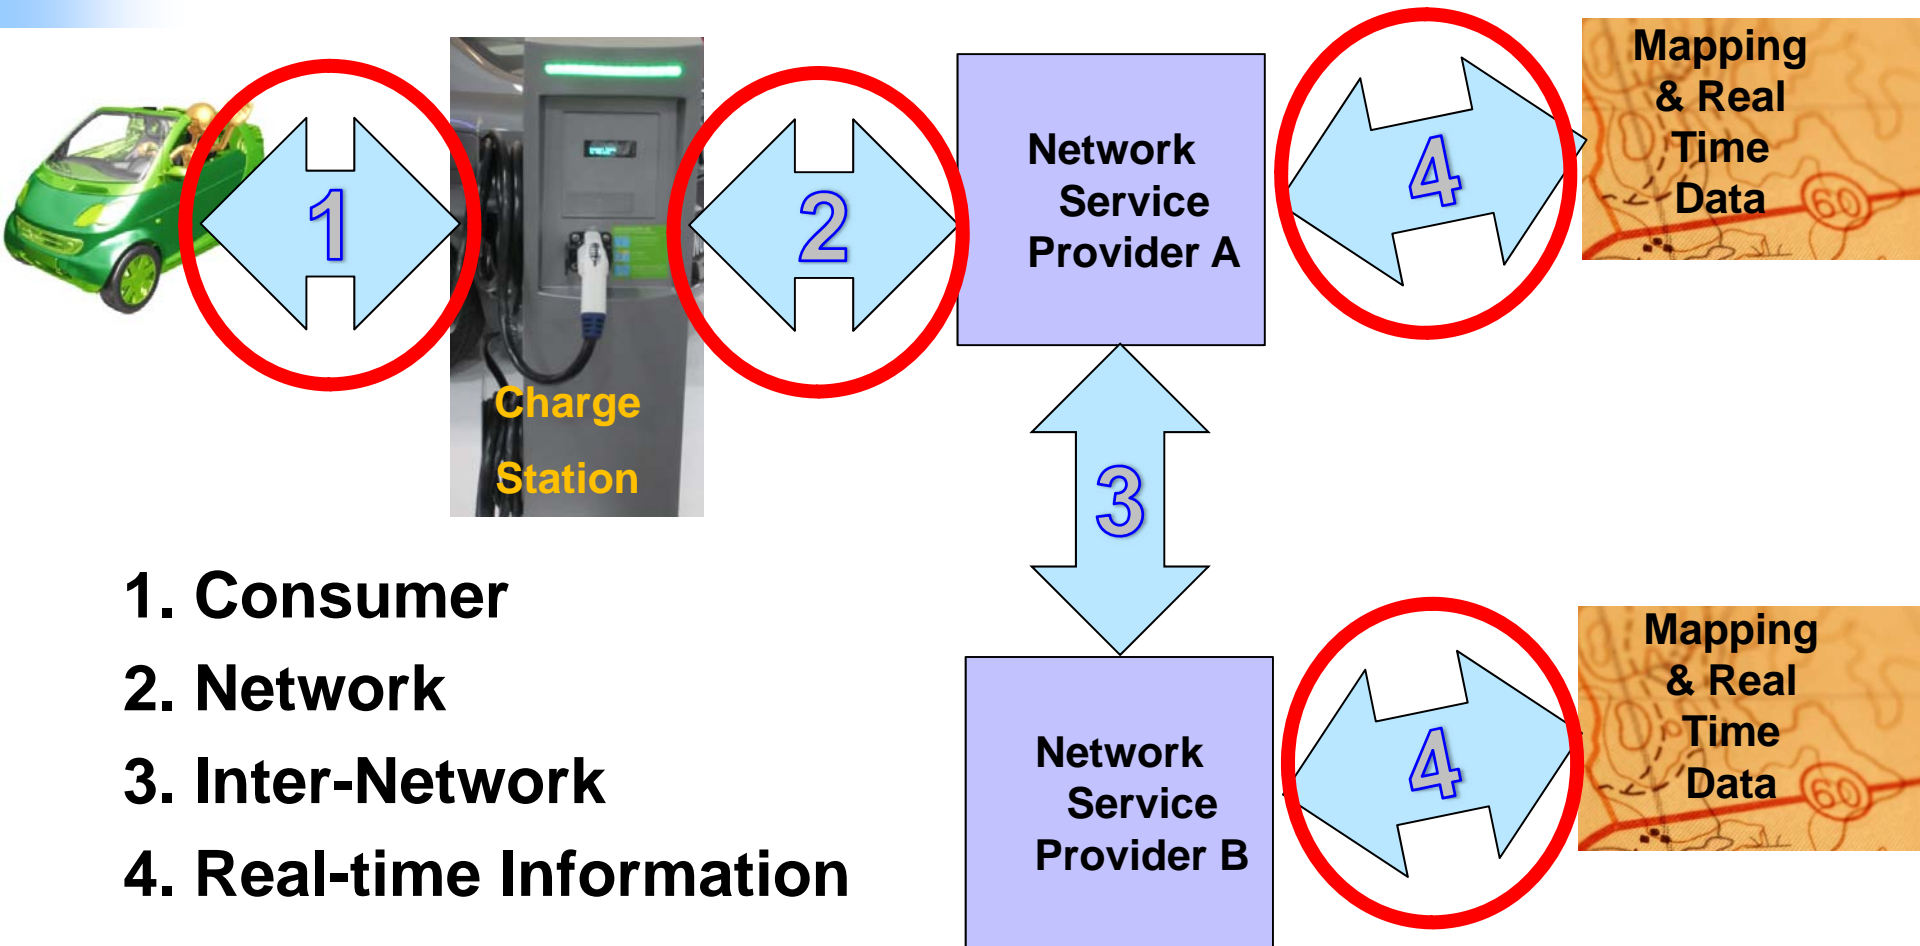

- Better Place installed a network of 77 EVSE stations in Hawaii
- >800 drivers subscribed to the Better Place Service ^[1]
 - They were provided RFID dongles
- Better Place sells network to OpConnect (Mar 2013)
- Better Place declared bankruptcy (May 2013)
- OpConnect now manages the network, but doesn't have access to the RFID dongles (which were proprietary)
 - Only users that already have the dongles can use the network right now (about 100 drivers *want* to use the network, but can't); service is being offered for free in the interim
- The fix - OpConnect plans to remove the Better Place EVSEs and replace them with their own EVSE – no mention of cost and schedule is “soon”

The Key Interfaces for Public Charging

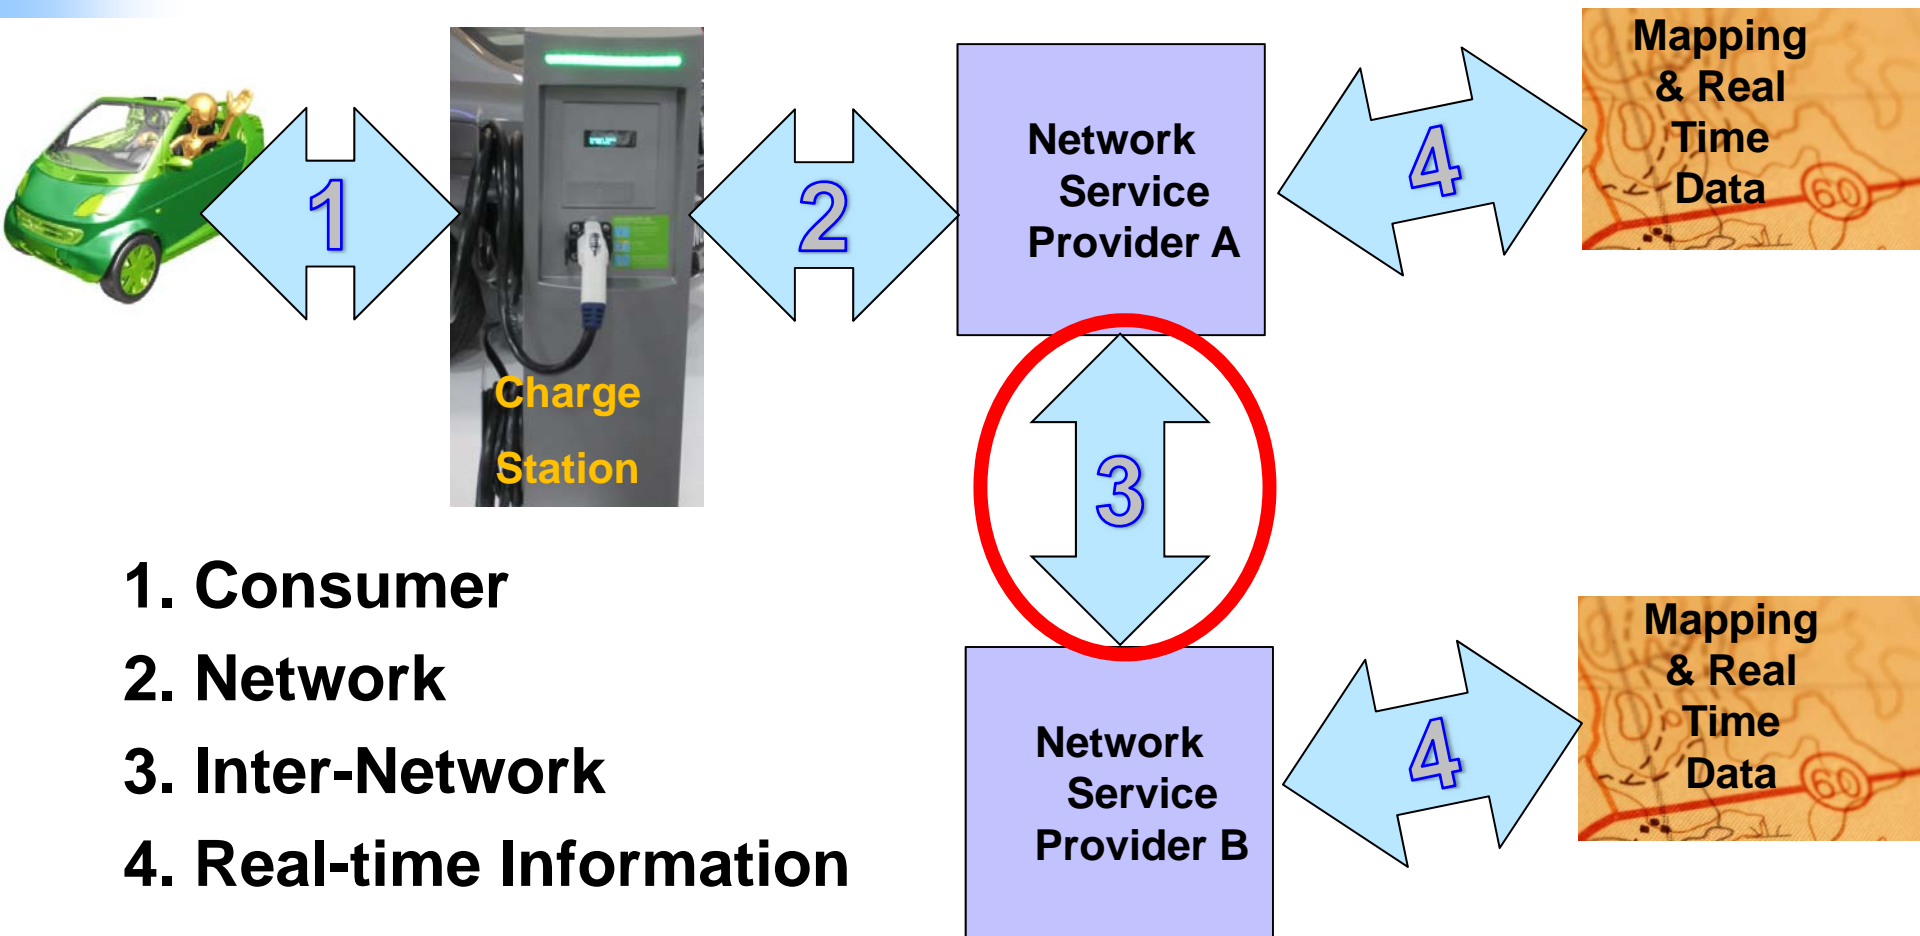

The Key Interfaces for Public Charging

Currently – These are Proprietary

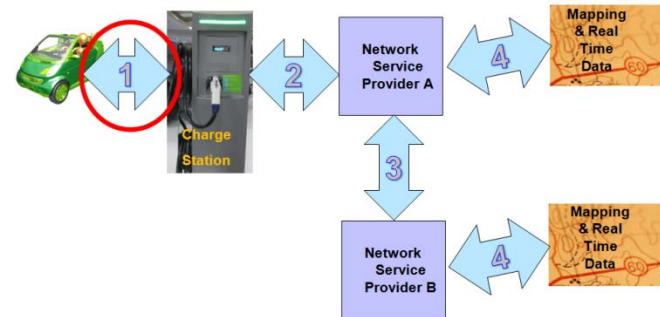

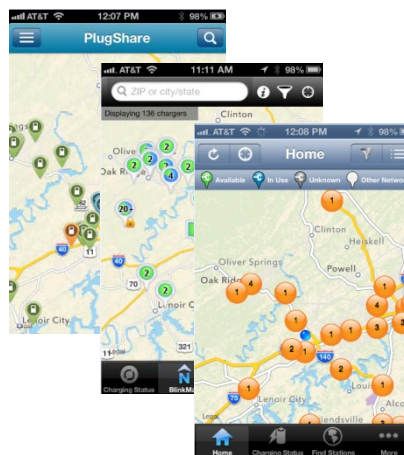

The Key Interfaces for Public Charging

Currently – This Interface Doesn't Exist

1. The Consumer Interface

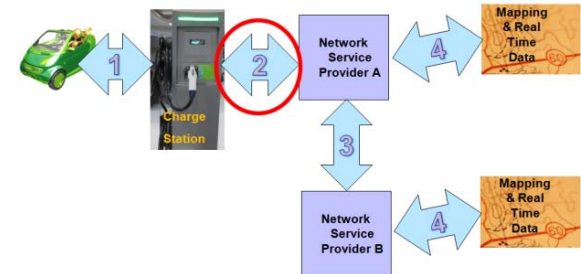

- Authenticates user
- Enables payment collection
- Many forms:
 - Phone app
 - Log-in
 - Scan a QR code
 - Credit card
 - Non-contact
 - Swipe
 - Call a Phone Number
 - RFID card
 - Key fob/dongle
 - PIN number

How many cards/dongles/phone apps/PIN numbers do I need?

Do all public EVSEs need to be on a network?

2. The Network

- This connection supports data flow between the charge stations (EVSE) and the network operator (EVSP)
 - User authentication; Payment; Station management
- Often uses public internet (via cellular modem or a wired connection)
- Might support other services
 - Maintenance
 - Data collection
 - Advertising

A Proprietary Network Means:

Selection of a charge station is limited to those that support a particular Network

Installed charge stations are locked to only those networks they can support

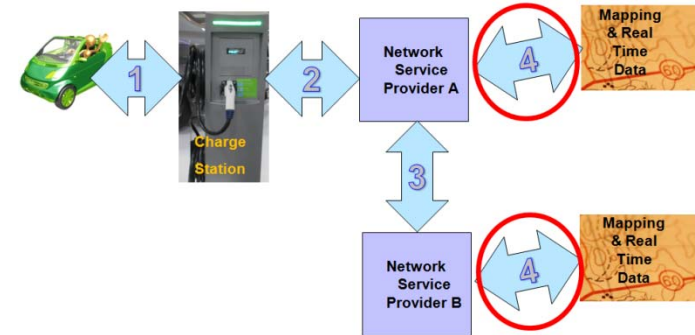

- Europe has widely deployed a standard network interface called the “Open Charge Point Protocol” – OCPP. This enables any OCPP-based charging station to use any OCPP based network; a site owner is not locked in to specific network provider

3. The Inter-Network Interface

- Currently consumers must have an account with each network provider they wish to use
- Linking networks would allow consumers to roam across networks but receive a single bill
- If this link included **all** network providers, then consumers need only carry one set of credentials
- Offers potential for combined real-time data and mapping
- This link does not exist today
 - Two network vendors (ChargePoint and ECOtality) announced formation of Collaboratev, an organization designed to fill this role (<http://www.collaboratev.com/>)

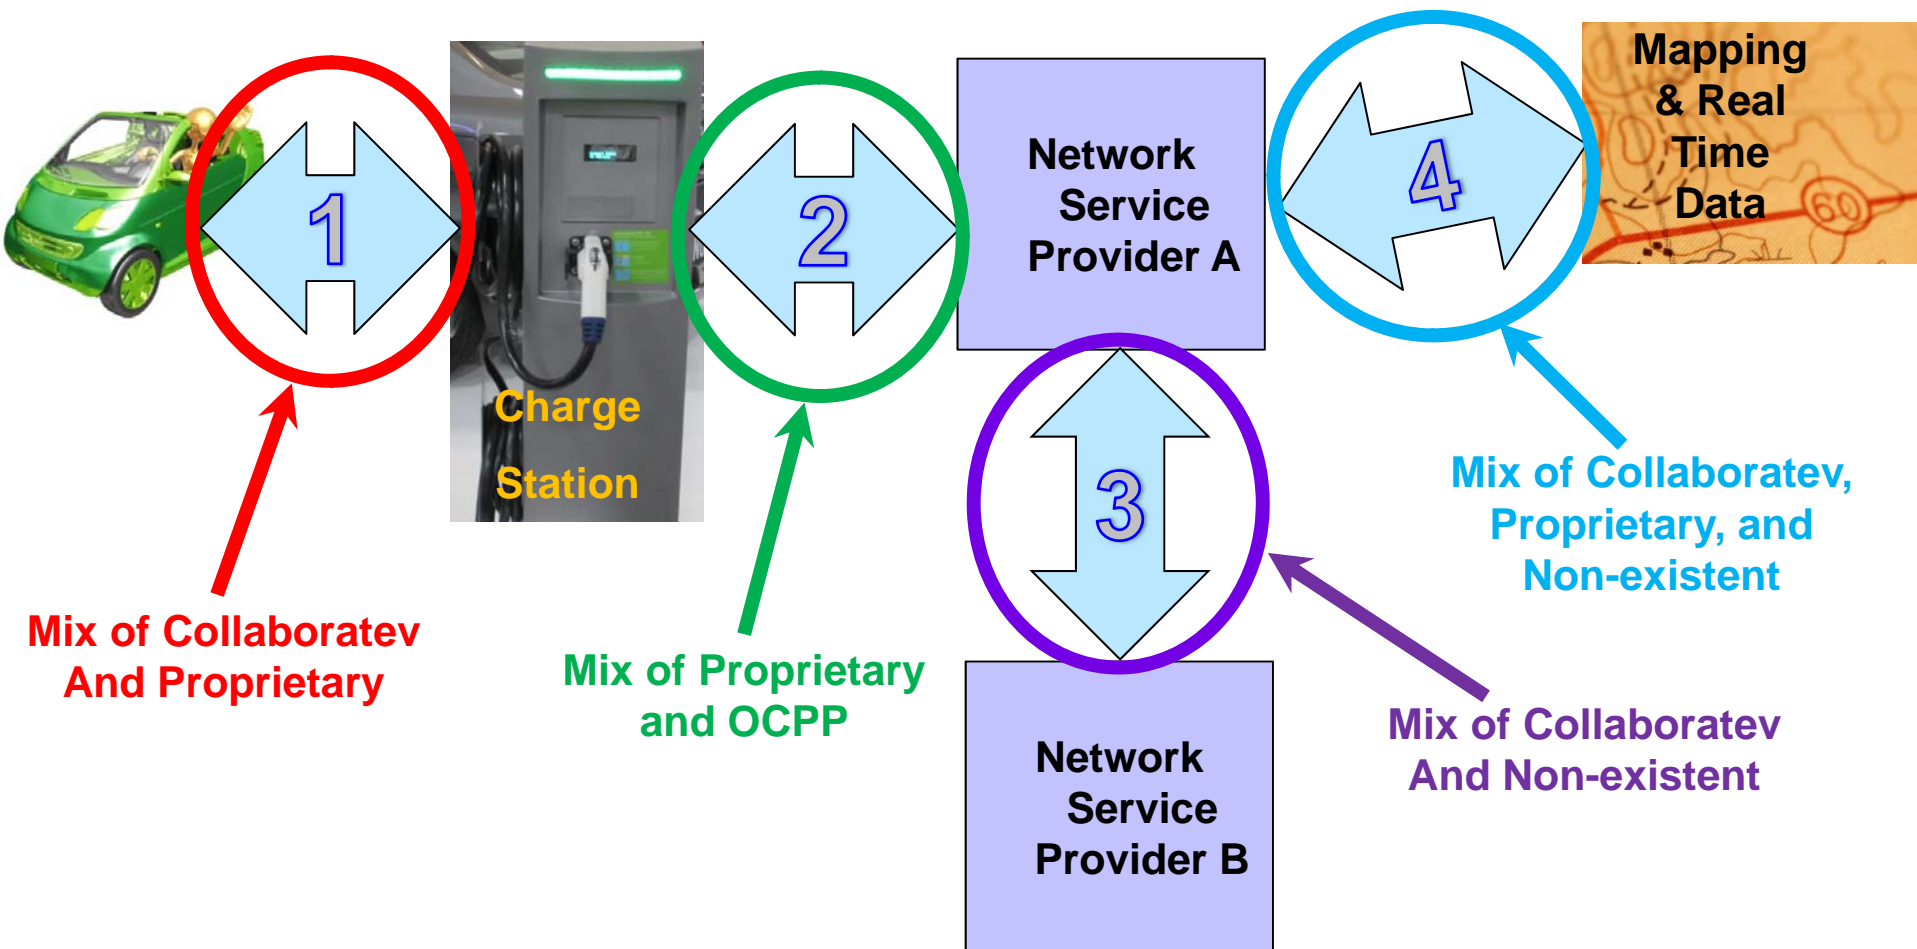

4. REAL-TIME INFORMATION

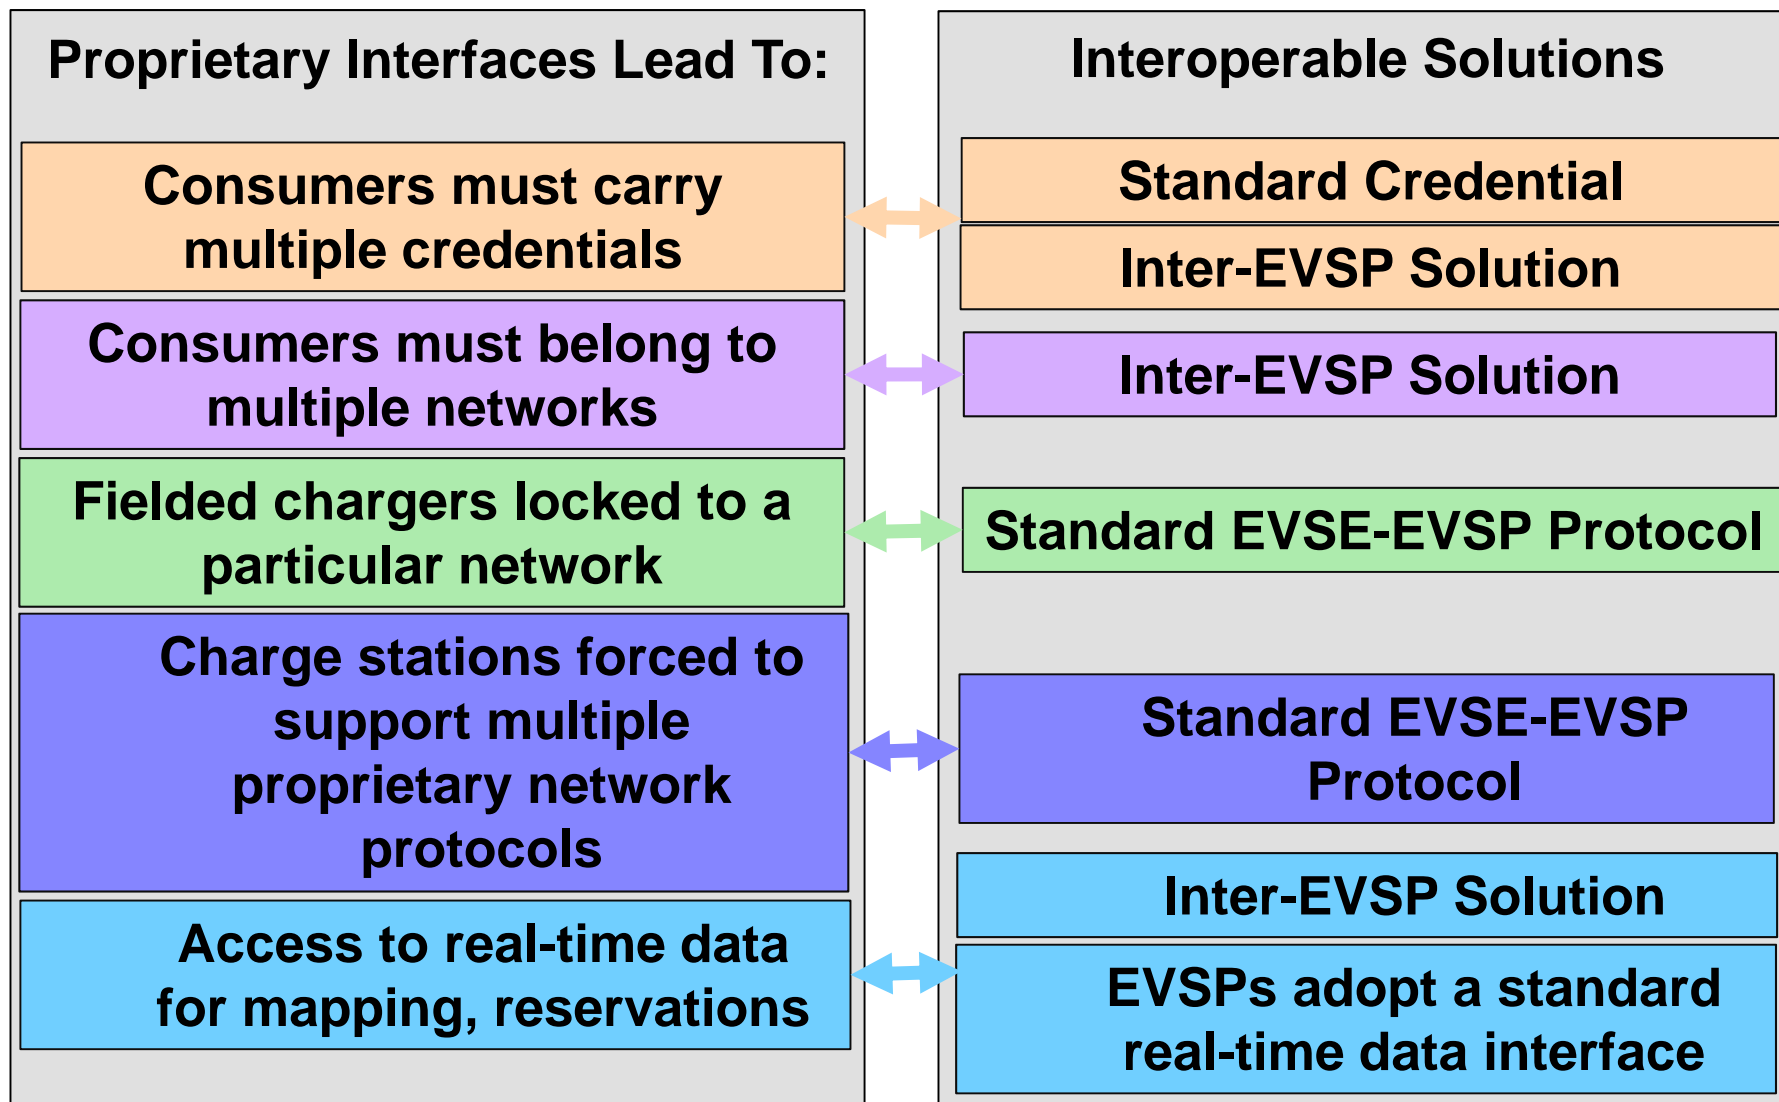

- Enables mapping applications that include all network brands
- Ability to make a station reservation across networks from one application
- Consumer won't have to consult several maps to see all charge station options
- Collaboratev plans to provide unified mapping
 - Would only support members of Collaboratev

Link for third parties to see Network data – primarily station status for map applications and potentially reservations

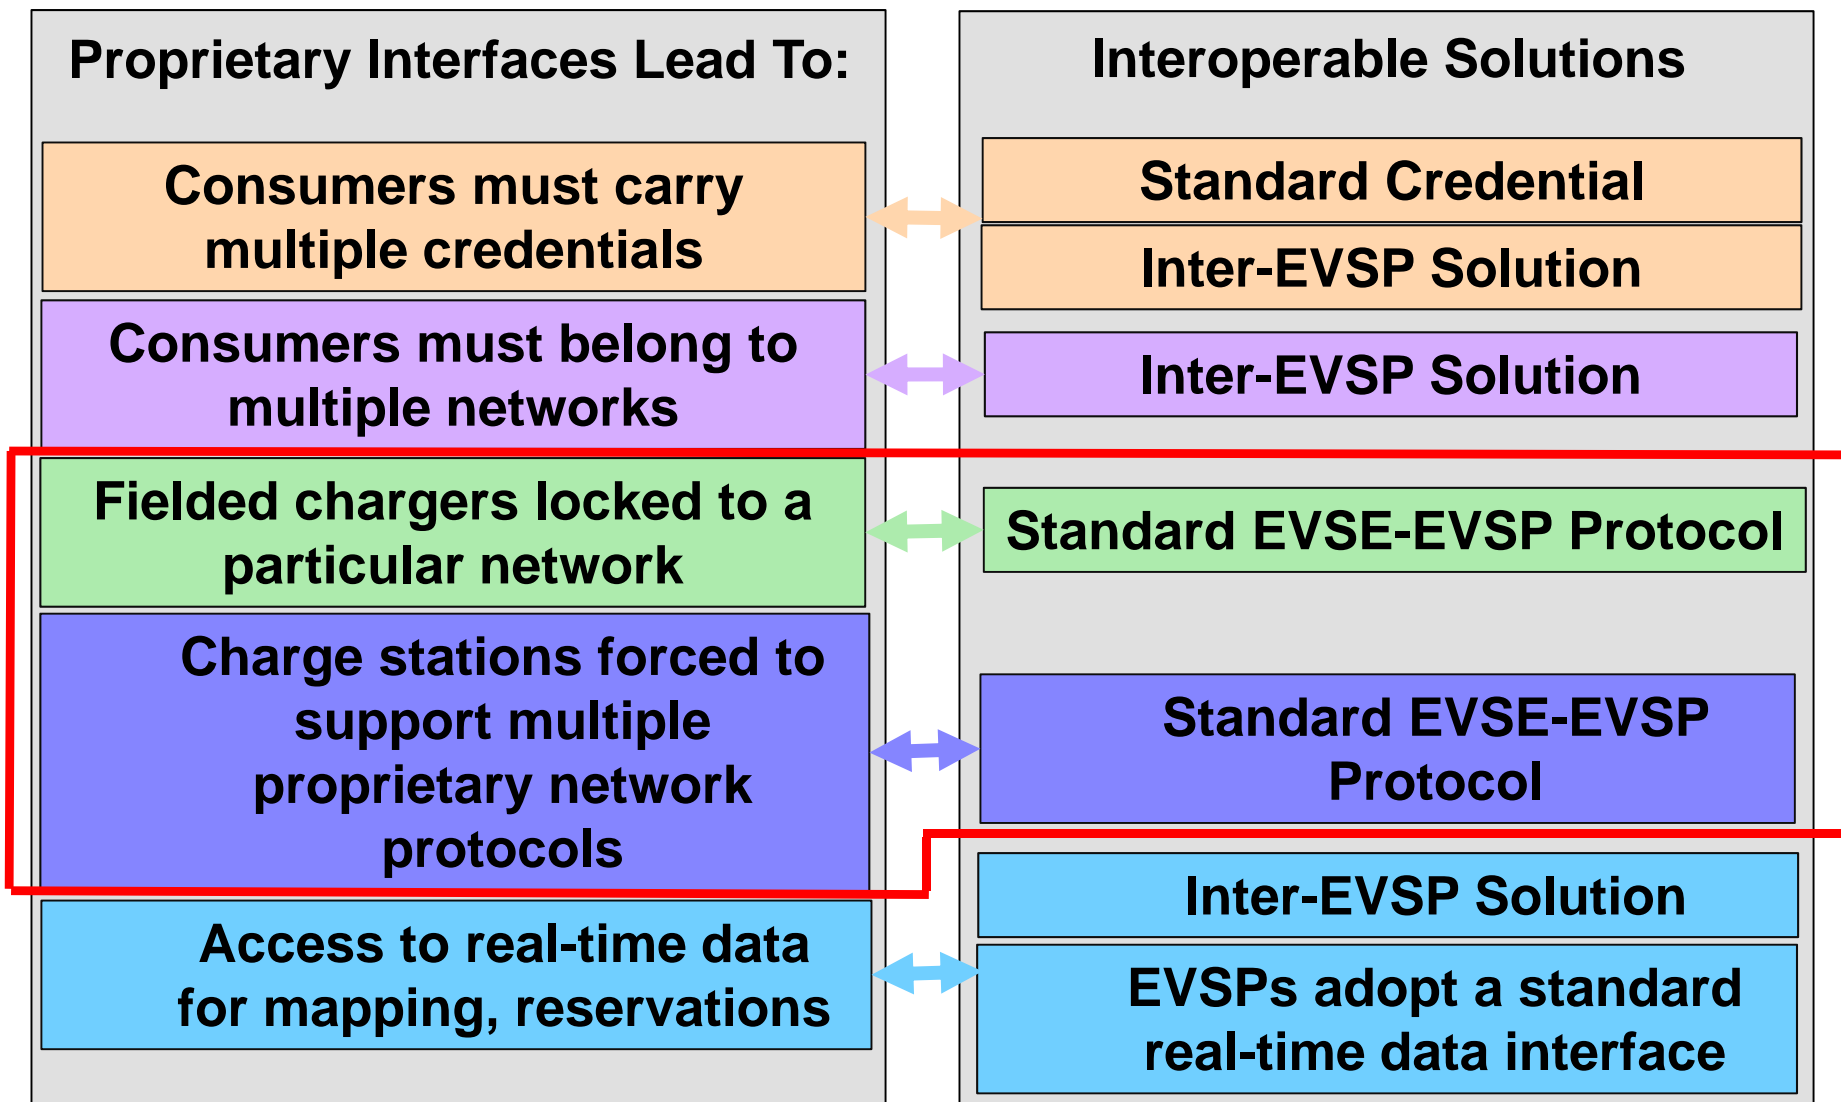

Where the market may go in the future...
